The levels of anti-neutrophil cytoplasmic antibodies (ANCAs) were measured in 30 patients with ulcerative colitis (UC) with and without relapse to see if these were related to relapse or severity. The median duration of disease before the anti-neutrophil cytoplasmic antibodies (ANCAs) were measured was 4.5 years. The ANCAs were detected in the serum of 11 of 30 patients (37%) and the median duration of the disease before ANCA measurement was 4.5 years. Ten of the 11 patients with ANCA-positive UC (91%) had relapse during a median follow-up period of 2.5 years. The risk of relapse during this period was significantly greater for patients with ANCA-positive UC than for those without ANCA. There was no difference in the severity of UC between patients with and without ANCAs at the time of initial diagnosis. These results suggest that the presence of ANCAs is related to the risk of relapse in UC.Q: Is it bad to flush the stream twice? I have a list of books that I need to search for in my database. Each book has a rating in my database (0-10). The rating column is of type integer. Now, I'm iterating through each book and if the rating is less than 3, I'd like to set it to 3. Here's what I've come up with so far: string searchTerm = "some search term"; List books = new List(); using (var conn = new SqlConnection("connectionString")) { conn.Open(); SqlCommand command = new SqlCommand("SELECT \* FROM Books WHERE BookName LIKE @searchTerm", conn); command.Parameters.AddWithValue("@searchTerm", searchTerm); var reader = command.ExecuteReader(); while (reader.Read()) { 82157476af
